Mathematics, Substance and Surmise Ernest Davis 2015-11-17 The seventeen thought-provoking and engaging essays in this collection present readers with a wide range of diverse perspectives on the ontology of mathematics. The essays address such questions as: What kind of things are mathematical objects? What kinds of assertions do mathematical statements make? How do people think and speak about mathematics? How does society use mathematics? How have our answers to these questions changed over the last two millennia, and how might they change again in the future? The authors include mathematicians, philosophers, computer scientists, cognitive psychologists, sociologists, educators and mathematical historians; each brings their own

expertise and insights to the discussion.

Nature's Capacities and Their Measurement

Nancy Cartwright 1989-08-10 This book argues for the place of capacities within an grounds of meaning, not method. Yet it is questions of method that should concern the modern empiricist: can capacities be measured? Cartwright argues that they are measured if anything is. Stanford University's Gravity-Probe-B will measure capacities in a cryogenic dewar deep in space. More mundanely, we use probabilities to measure capacities, and the assumptions required to ensure that probabilities are a reliable instrument are investigated in the opening chapters of this book, where the early methods of econometrics set a model. The last chapter applies lessons about probabilities and capacities to quantum mechanics and the Bell inequalities. The central thesis throughout is that capacities not only can be admitted by

empiricists, but indeed must be - otherwise the empirical methods of modern science will make no sense.

Ray Shooting, Depth Orders and Hidden Surface Removal

Mark de Berg 1993-08-30
Computational geometry is the part of theoretical computer science that concerns itself with geometrical objects; it aims to define efficient algorithms for problems involving points, lines, polygons, and so on. The field has gained popularity very rapidly during the last decade. This is partly due to the many application areas of computational geometry and partly due to the beauty of the field itself. This monograph focuses on three problems that arise in three-dimensional computational geometry. The first problem is the ray shooting problem: preprocess a set of polyhedra into a data structure such that the first polyhedron that is hit by a query ray can be determined quickly. The second problem is that of computing depth orders: we want to sort a set of polyhedra such that if one polyhedron is

(partially) obscured by another polyhedron then it comes first in the order. The third problem is the hidden surface removal problem: given a set of polyhedra and a view point, compute which parts of the polyhedra are visible from the view point. These three problems involve issues that are fundamental to three-dimensional computational geometry. The book also contains a large introductory part discussing the techniques used to tackle the problems. This part should interest not only those who need the background for the rest of the book but also anyone who wants to know more about some recent techniques in computational geometry.

Statistical Studies of Historical Social Structure

Kenneth W. Wachter 2013-10-22
Statistical Studies of Historical Social Structure articulates and applies concepts from statistics into historical investigations of pre-industrial English households. The book provides statistical reports on household composition and demographic influences and uses simulation in the study of problems in historical structure. Chapters are devoted to computer simulation experiments; presentation and analysis of English household composition data; correlation of English patriline extinction with social mobility; and how age distribution affects English social structure. Statisticians, historians, demographers, researchers, and students will find the book interesting.

Principles and Proofs Richard D. McKirahan Jr. 2017-03-14
By a thorough study of the Posterior Analytics and related Aristotelian texts, Richard McKirahan reconstructs Aristotle's theory of episteme--science. The Posterior Analytics contains the first extensive treatment of the nature and structure of science in the history of philosophy, and McKirahan's aim is to interpret it sympathetically, following the lead of the text, rather than imposing contemporary frameworks on it. In addition to treating the theory as a whole, the author uses textual and philological as well as philosophical material to interpret many important but difficult individual passages. A number of issues left obscure by the Aristotelian

material are settled by reference to Euclid's geometrical practice in the Elements. To justify this use of Euclid, McKirahan makes a comparative analysis of fundamental features of Euclidian geometry with the corresponding elements of Aristotle's theory. Emerging from that discussion is a more precise and more complex picture of the relation between Aristotle's theory and Greek mathematics--a picture of mutual, rather than one-way, dependence. Plant Nutrition for Sustainable Food Production and Environment Tadao Ando 1997-12-31 In the history of the International Plant Nutrition Colloquium from its first meeting in 1954, this meeting, the 13th Colloquium, is the first to be held in Asia and will be the last in the 20th century. The 20th century has seen huge changes in the number and activities of mankind. Our population has increased from around 1.7 billion to more than 5.8 billion and technological innovations have completely altered our way of living. As a consequence of such rapid change, we are facing many problems including changes in our environment of a global scale. But, while food shortage has been a serious concern to mankind throughout our history, serious food shortages in the 20th century have been confined to limited times and areas. As Lester Brown discusses in this volume, farmers have increased food production heroically on demand. We, the plant nutritionists should be proud of our support to the world's farmers which has helped them make their achievement possible. During the 20th century, the science of plant nutrition also has achieved great progress as described by Jack Loneragan; it became established as a discipline firmly based in science, defined the chemical elements supporting plant growth, and

has contributed to improvements in plant production and environmental quality, as readers will find in many contributions in this volume. *SAT Math Prep* Kaplan Test Prep 2017-07-04 Kaplan's SAT Math Prep provides the realistic practice, key concepts, and expert advice you need to master the most important math topics on the test. Surgery: Problems and Solutions Andrew Goldberg 2008-08-08 As the first in the "Clinical Talk" series, the philosophy of this book is to have a set of question-based sections to help a final-year medical student prepare for exams. These sections include multiple choice questions (MCQs), extended matching questions (EMQs) and case studies. The idea is to have not just a "test yourself" book, but one which students can work through as a learning exercise as well as for revision purposes. For that reason, the answers and explanations provided here are just as important as the questions themselves. Stansby and Goldberg have structured this book such that it complements one of their bestselling textbooks, *Surgical Talk: Revision in Surgery*.

Oxford Studies in Metaphysics Volume 2 Dean Zimmerman 2006-03-23 Oxford Studies in Metaphysics is the forum for the best new work in this flourishing field. Much of the most interesting work in philosophy today is metaphysical in character: this new series is a much-needed focus for it. OSM offers a broad view of the subject, featuring not only the traditionally central topics such as existence, identity, modality, time, and causation, but also the rich clusters of metaphysical questions in neighbouring fields, such as philosophy of mind and philosophy of science. Besides independent essays, volumes will often contain a critical essay on a recent book, or a symposium that allows participants to respond to one another's criticisms and questions. Anyone who wants to know what's happening in metaphysics can start here. Volume Two begins with a major paper on consciousness by Ned Block. Block examines 'Max Black's Objection to Mind-Body Identity', an argument for a dualism of physical and phenomenal properties, closely related to Jackson's 'knowledge argument'. His extensive exploration of this family of arguments for property dualism includes considerable discussion of John Perry and Stephen White; their responses to Block's paper complete the section on the metaphysics of consciousness. Three papers consider the thesis that the future is, in some sense, 'open'. Eli Hirsch elaborates a view according to which contingent statements about the future can be indeterminate in truth-value, while preserving 'straight logic', including a principle of bivalence. Peter Forrest defends a sort of 'growing block' theory of the passage of time, emphasizing the way such a metaphysics, combined with a truth-maker principle, can provide an analysis of natural necessity. Trenton

Merricks presents a trenchant and original criticism of the 'growing block' theory of time. The volume continues with a group of papers on problems of ontology. Thomas Hofweber's paper, defending nominalism from the objection that there are 'inexpressible' properties and propositions, won the first annual Oxford Studies in Metaphysics Younger Scholar Prize. The papers by Phillip Bricker and Michael Loux examine a couple of deep divides within ontology. John Hawthorne's paper raises some extremely puzzling questions about the nature of persons, given the ontology needed for Timothy Williamson's theory of vagueness. Hawthorne uses these problems to motivate an alternative style of epistemicism. The final three papers take up several issues in the metaphysics of traditional theism. Michael Bergmann and Jeffrey Brower raise objections to combining a Platonic conception of universals with the doctrine of divine aseity; while Brian Leftow defends a non-Platonic theory of universals - a kind of divine-concept nominalism. Hud Hudson suggests that contemplation of the possibility of higher dimensions opens up new avenues in theodicy. *Algebra and Trigonometry* Cynthia Y. Young 2017-11-20 Cynthia Young's *Algebra & Trigonometry, Fourth Edition* will allow students to take the guesswork out of studying by providing them with a clear roadmap: what to do, how to do it, and whether they did it right, while seamlessly integrating to Young's learning content. *Algebra & Trigonometry, Fourth Edition* is written in a clear, single voice that speaks to students and mirrors how instructors communicate in lecture. Young's hallmark pedagogy enables students to become independent, successful learners. Varied exercise types and modeling projects keep the learning fresh and motivating. *Algebra & Trigonometry 4e* continues Young's tradition of fostering a love for succeeding in mathematics.

Formal Axiology and Its Critics Rem Blanchard Edwards 1995 Formal Axiology and Its Critics consists of two parts, both of which present criticisms of the formal theory of values developed by Robert S. Hartman, replies to these criticisms, plus a short introduction to formal axiology. Part I consists of articles published or made public during the lifetime of Hartman to which he personally replied. It contains previously published replies to Hector Neri Castañeda, William Eckhardt, and Robert S. Brumbaugh, and previously unpublished replies to Charles Hartshorne, Rem B. Edwards, Robert E. Carter, G.R. Grice, Nicholas Rescher, Robert W. Mueller, Gordon Welty, Pete Gunter, and George K. Plochmann in an unfinished but now completed article on which Hartman was working at the time of his death in 1973. Part II consists of articles presented at recent annual meetings of the R.S. Hartman Institute for Formal and Applied Axiology that continue to criticize and further develop Hartman's formal axiology. An article by Rem B. Edwards raises serious unanswered questions about formal axiology and ethics. Another by Frank G. Forrest shows how the formal value calculus based on set theory might answer these questions, and an article by Mark A. Moore points out weaknesses in the Hartman/Forrest value calculus and develops an alternative calculus based upon the mathematics of quantum mechanics. While recognizing that unsolved problems remain, the book intends to make the theoretical foundations and future promise of formal axiology much more secure.

The William Lowell Putnam Mathematical Competition 2001-2016: Problems, Solutions, and Commentary Kiran S. Kedlaya 2020-11-05 The William Lowell Putnam Mathematics Competition is the most prestigious undergraduate mathematics problem-solving contest in North America, with thousands of students taking part every year. This volume

presents the contest problems for the years 2001–2016. The heart of the book is the solutions; these include multiple approaches, drawn from many sources, plus insights into navigating from the problem statement to a solution. There is also a section of hints, to encourage readers to engage deeply with the problems before consulting the solutions. The authors have a distinguished history of engagement with, and preparation of students for, the Putnam and other mathematical competitions. Collectively they have been named

Putnam Fellow (top five finisher) ten times. Kiran Kedlaya also maintains the online Putnam Archive.
